Experience

Software Engineer – Apex Fintech Solutions

Austin, TX

June 2025 – Present

- Architected remote build caching for the monorepo (~2,000 builds/day), reducing average build times from 45 minutes to under 6 minutes. Overhauled linter configurations and fixed non-deterministic build outputs to maximize cache hit rates.
- Migrated the monorepo build system from Bazel WORKSPACE to bzlmod, upgrading severely outdated dependencies and validating dependency chains across 150–200 services to prevent runtime regressions.
- Prototyped AI developer tooling in a company hackathon; selected by AI team for production buildout. Provisioned a Vertex AI platform with service account gating, per-team configuration, and an ROI engine benchmarking agent output against engineer-hours.
- Built AI agents for code review, implementation, documentation, and test framework auto-healing — each with full build and test access via the remote cache and GitHub Actions.
- Engineered a RAG-based MCP server backed by curated historical data extracts, enabling a partner team's agents to retrieve semantically similar past requests and enforce team-specific review protocols.
- Shipped hotfix automation and post-deploy test visibility features into an internal React deployment platform, reducing manual deployment steps to a single commit SHA input.
- Served as GitHub and Terraform administrator, managing deployments, dependency management, and infrastructure tooling across the platform team.
- Pitched AI tooling initiative to leadership to secure funding post-hackathon; presented results to executives at 6-month and 1-year reviews. Mentored 2 new grad engineers and co-created a technical training curriculum.

Platform Engineering Intern – ATPCO

Remote

Jan 2025 – Mar 2025

- Deployed automation workflows with AWS Lambda and S3; maintained mainframe job scheduling and on-call operations using BMC Control-M.

Software Engineering Intern – Deere

Remote

July 2024 – Nov 2024

- Built the MVP backend for a tax lien marketplace as part of a Y Combinator application using Python and Flask.

Projects

Vertical – Agentic Video Generation Platform

- Co-built a canvas-based platform for AI-driven video generation using node-based workflows, enabling automatic content generation from shot lists and scripts to final video output.
- Designed the agent toolkit powering each node — integrating Gemini for brainstorming and iteration, and Veo for video synthesis.
- Tools: Gemini, Veo, Google Cloud, Supabase, React, Python

Education

University of California, Davis – B.S. Computer Science

Graduated June 2025

Technologies

Languages: Go, Python, JavaScript, SQL, Bash

AI: Claude API, Vertex AI, Gemini, Veo, OpenAI, RAG, MCP

Infrastructure: Bazel, Docker, Kubernetes, Terraform, ArgoCD, GitHub Actions

Frameworks & Tools: React, Node.js, Flask, Datadog, Supabase, AWS (EC2, Lambda, S3), GCP
